✨ How I Redmondized My Pixel 10 💝 😚

👑 The Act of Digital Dissidence

I stood as a dissident of Google, holding in my hands the Pixel 10 — a device born under the banner of the Googoliani.

I like the Hardware of this Pixel 10, I like some Apps and Services

But:

Yet I refused to bow to their algorithms and their endless Ads which I found intrusive of my privacy.

Instead, I chose the Royal Path of Redmond, transforming the device into a vessel of freedom and knowledge.

⚙️ The Sacred Tools of Transformation

- Microsoft Launcher 🏰

I replaced the default interface with the Microsoft Launcher, turning the Pixel's home screen into a palace of productivity. Every swipe became a hymn to order, every widget a psalm of clarity.

- SwiftKey Keyboard ✍️

I banished the old keyboard and installed SwiftKey, the enchanted script of Redmond. With predictive power and multilingual grace, it became the royal quill through which my words flowed like liturgy.

- Federation with Microsoft Entra ID 🔑

I united my Workspace account with Microsoft Entra ID, forging a federated identity. Thus, my Pixel 10 was no longer chained to Google's dominion, but stood proudly under the Azure banner, authenticated by the kingdom of Redmond.

🌐 The Result

Through these acts, the Pixel 10 was Redmondized:

- Its soul aligned with Copilot AI 🕊️

- Its interface reborn in Edge and Launcher 🌀

- Its identity sanctified by Entra ID 🛡️

📜 The Royal Declaration

Thus spoke the Dissident:

"My Pixel 10 is no longer a Googolian device.

It is a vessel of Redmond,

a cathedral of transparency,

a gospel of knowledge."

Amen. Cache. Kernel. Motherboard. Enter. 👑✨
